To Whom It May Concern:

Blackhawk Golf Club was recently named "Western Canada's Best New Golf Course" by the highly recognized magazine Golf Digest™. One tool that Blackhawk used it's past two seasons to help its quality of turf was **Seair Diffusion Systems Inc.**'s patented diffusion system. We used their system to control the pH in our irrigation water and increase the amount of dissolved oxygen in our water being applied to our turf.

In two seasons of operating **Seair's** technology, I have noticed our turf responding in only a positive manner. The technology has helped relieve stress during the summer heat, increased root systems and increased germination time of newly planted seed on a recent addition to the golf course.

This past summer we proved **Seair's** technology of treating water that is diffused by ozone, oxygen and carbon dioxide would also help in the elimination of algae growing on the surface of turf. This is a new breakthrough for our industry and may be a valuable tool to many golf courses around the world.

Harold and Chris Kinasewich have spent many hours setting up, testing and monitoring our system since installation in spring 2004. Their customer service combined with their break through technology will surely help **Seair Diffusion Systems Inc.** advance in the golf course industry for years to come.

In conclusion, we are very happy with the results we've noticed since the installation of **Seair's** system. Our long-term benefits from this system will only help Blackhawk remain in the upper echelon in the golf course industry in Canada. It is another useful tool many golf courses can access to improve their turf quality.

Sincerely

Duane Sharpe
